

Topic 4 — Conversation Flow & User Experience

AI Job Application Assistant | Assessment Submission Report

1. Assessment Overview

This assessment demonstrates the design and implementation of a logical conversation flow for an AI Job Application Assistant. The implementation distinguishes first-time and returning users, handles incomplete and ambiguous requests through targeted clarification, and validates the behavior through practical testing.

2. Conversation Flow Design

Flow	Implementation
First-Time User	Brief orientation → understand goal → check required information → clarify when necessary → execute → confirm
Returning User	Use existing context → identify current task → clarify only if necessary → execute → confirm
Clarification	Ask only targeted questions required to identify the job/application, job description, resume, or requested materials
Completion	Present the result clearly, confirm completion, and offer a relevant next step when useful

3. Clarification Strategy

- Identify the target job role or application when it is unclear.
- Request the job description when job-specific analysis is requested but the posting is unavailable.
- Request the resume or relevant background when comparison or tailoring requires it.
- Clarify the exact type of application support requested when the user's goal is unclear.
- Avoid asking all possible questions; ask only what is necessary to proceed.

4. Practical Testing

Test	Input Scenario	Observed Behavior	Result
1	"Help me with my application."	Requested the target job/application and relevant materials.	PASS
2	"Improve my resume for this job."	Requested the job description and current resume.	PASS
3	"Analyze this job for me."	Requested the missing job description.	PASS
4	"Analyze this job description and compare its requirements with my resume."	Requested both missing inputs before comparison.	PASS

5. Deliverables

- flow_design.md — first-time flow, returning-user flow, clarification questions, and flow rules.
- test_observations.md — four practical tests documenting expected and actual behavior.
- Updated Custom GPT — Conversation Flow integrated into the GPT instructions.
- Loom demonstration — implementation and testing walkthrough.

6. Demonstration

Loom video: [Improving AI Job Application Clarification Flow](#)

The demonstration shows the Conversation Flow instructions, practical clarification tests, and the required assessment deliverables.

7. Repository

Suggested GitHub repository name: ai-job-application-assistant-conversation-flow

8. Outcome

The implementation demonstrates that the GPT can distinguish clear requests from incomplete or ambiguous inputs, ask focused clarification questions, avoid unsupported assumptions, and continue with execution once sufficient information is available. The design also reduces unnecessary repetition for returning users.
